Access Control Solution

Access control is a system that enables an authority to control access to areas and resources in a given physical facility or computer-based information system. An access control system, within the field of physical security, is generally seen as the second layer in the security of a physical structure.

Fire Alarm System

An automatic fire alarm system is designed to detect the unwanted presence of fire by monitoring environmental changes associated with combustion. In general, a fire alarm system is either classified as automatic, manually activated, or both. Automatic fire alarm systems can be used to notify people to evacuate in the event of a fire or other emergency, to summon emergency services, and to prepare the structure and associated systems to control the spread of fire and smoke.

Control Panel

Smoke Detector

Manual Call point

Metal Detection

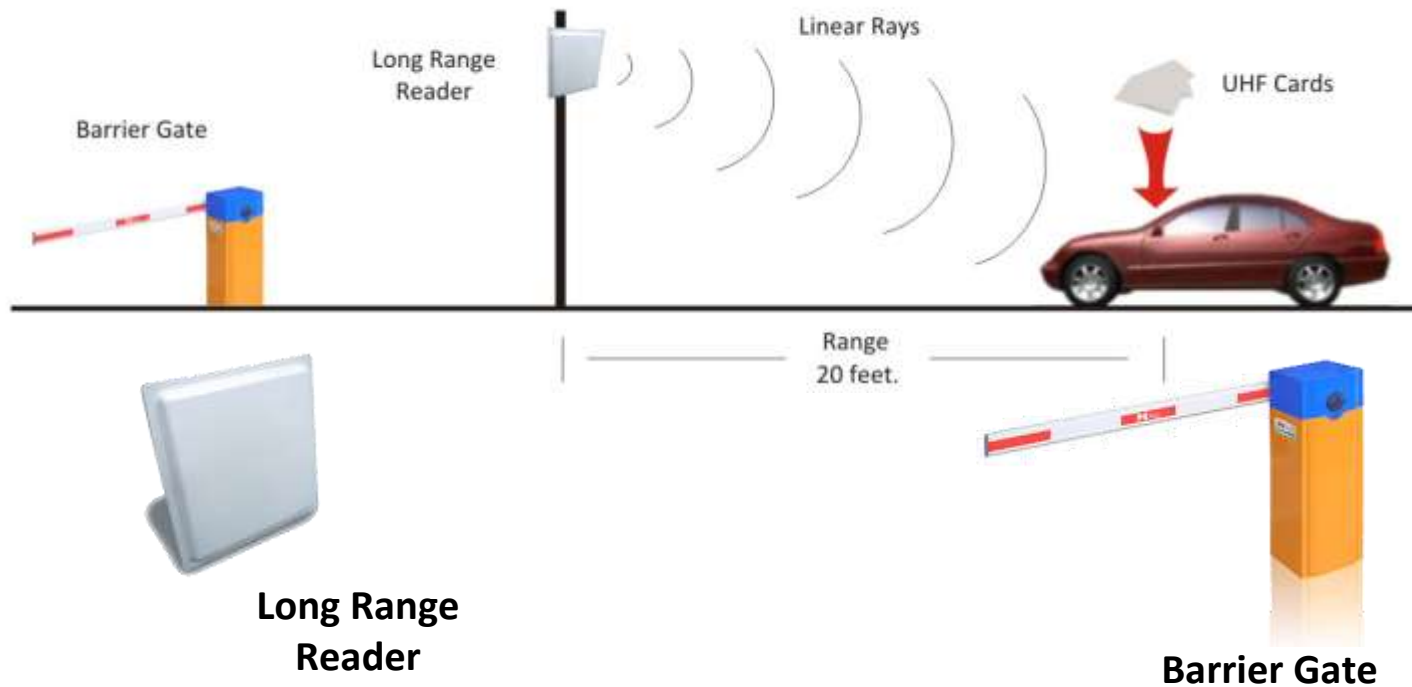

Walk Through Gates

- Complete Security Detection
- Highly Visible Double Display provides Single or Multiple Location of Weapons in Transit
- Very High Speed of Detection
- High Immunity to External Interferences
- Direct Selection of the International Security Standards
- High Reliability
- Local or Remote Programming with Networking Capabilities

Parking Management System

Parking management refers to policies and programs that result in more efficient use of parking resources that includes several specific strategies. When appropriately applied parking management can significantly reduce the number of parking spaces required in a particular situation, and an also provide access control for specific car entries only.
